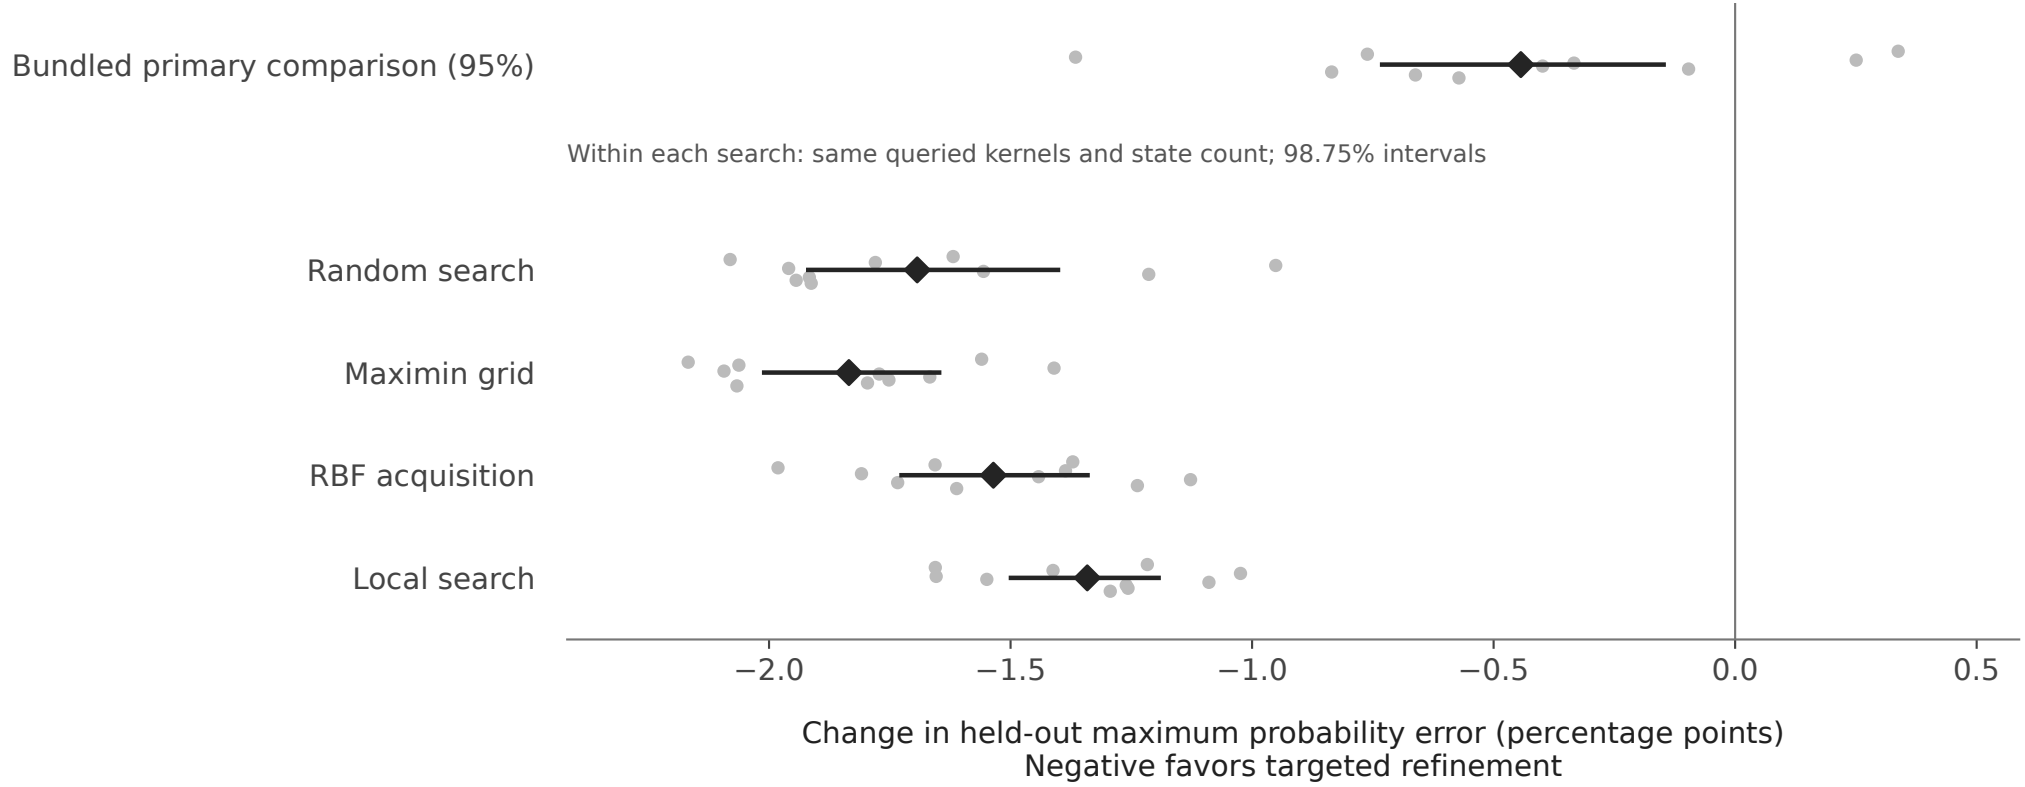
Refinement versus matched-capacity controls

300 response-changing worlds; 16 fixed held-out environments; horizon 10.
Ten shared seed clusters, not individual worlds or predictions, determine uncertainty.



Gray dots: seed-level effects. Black diamond: paired mean. Lines: seed-cluster bootstrap intervals (5,000 replications).

Primary compares RBF/targeted with random-search/random-capacity strategies and can differ in capacity. The four lower rows isolate refinement.
